License Agreement

Android Studio

License: android-studio

Android SDK Platform 26

Terms and Conditions

This is the Android Software Development Kit License Agreement

1. Introduction

1.1 The Android Software Development Kit (referred to in the License Agreement as the "SDK" and specifically including the Android system files, packaged APIs, and Google APIs) will only be licensed to you subject to the terms of the License Agreement. The License Agreement forms a legally binding contract between you and Google in relation to your use of the SDK.

1.2 "Android" means the Android software stack for devices, as made available under the Android Open Source Project, which is located at the following URL: <http://source.android.com/>, as updated from time to time.

1.3 A "compatible implementation" means any Android device that (i) complies with the Android Compatibility Definition Document, which can be found at the Android compatibility website (<http://source.android.com/compatibility/>) and which may be updated from time to time; and (ii) successfully passes the Android Compatibility Test Suite (CTS).

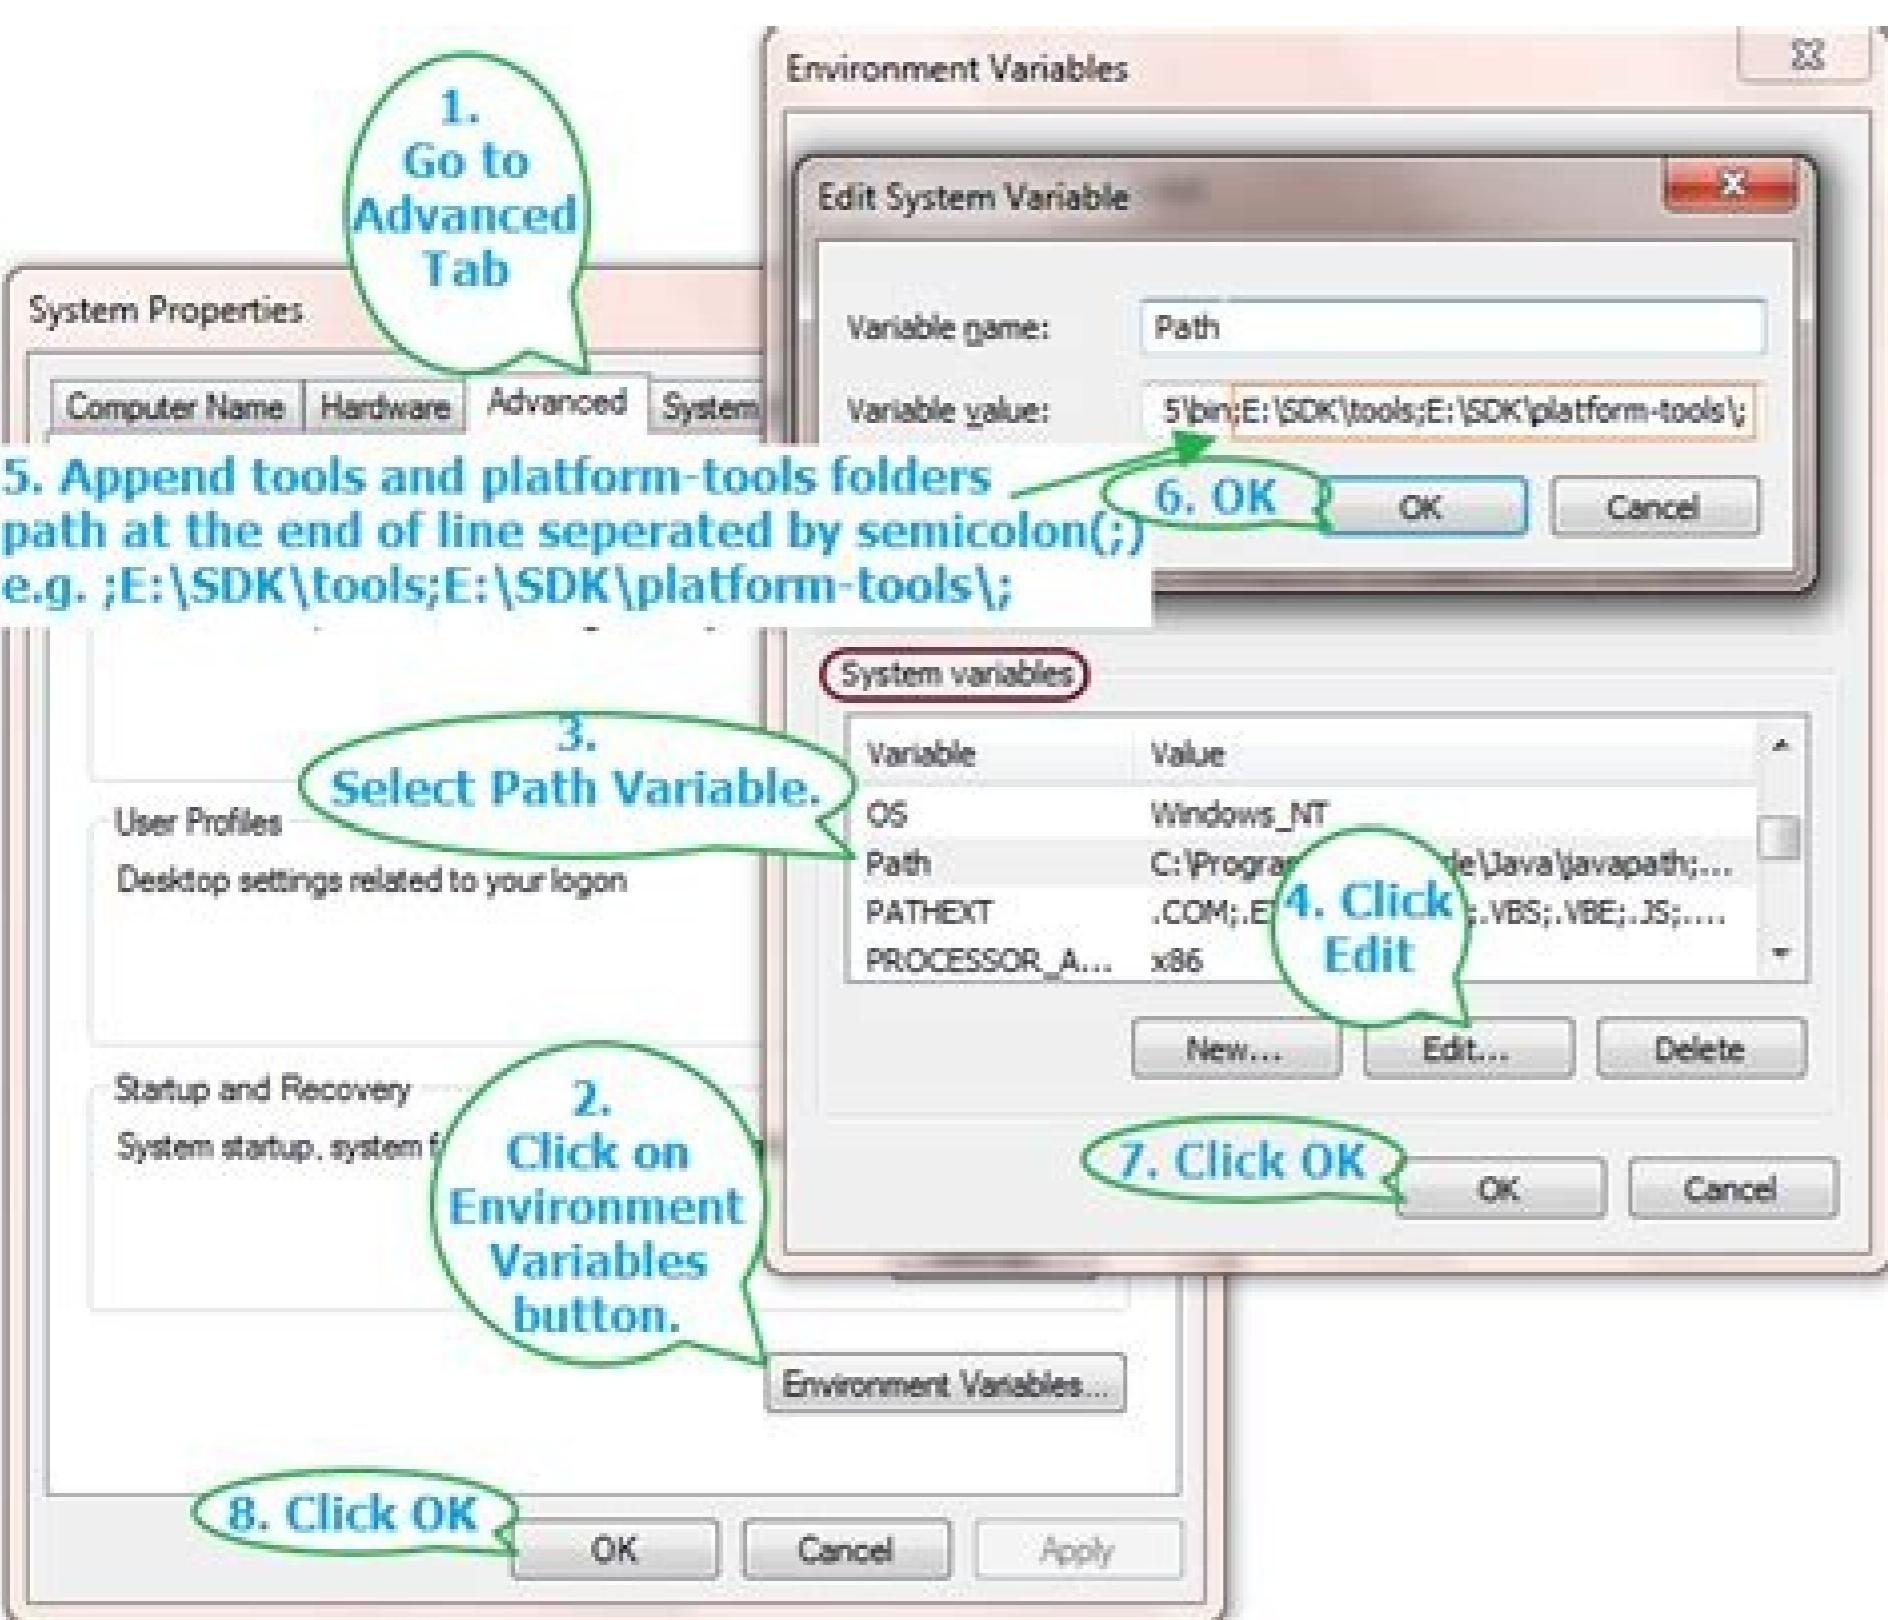

1.4 "Google" means Google Inc., a Delaware corporation with principal place of business at 1600 Amphitheatre Parkway, Mountain View, CA 94040, United States.

2. Accepting the License Agreement

Messages window: Error: Gradle: 'android:android:targetSdkVersion' attribute not found. Consult IDE log for more details (http://tools.android.com/tech-docs/tips-for-troubleshooting-gradle-build-errors).

Android\_home nor android\_sdk\_root environment variable was exported. Android sdk home directory. Android\_sdk\_home is set to the root of your sdk. Select android sdk home. Export android\_home=\$home/android/sdk. Android\_home sdk location not found. Android\_sdk\_root=undefined (recommended setting) android\_home=undefined (deprecated). Android\_home sdk location.

If you don't have an Android device available to test with, we recommend using the default emulator that comes with Android Studio. If you run into any problems setting it up, follow the steps in this guide. Download and install Android Studio 3.0+. Select "Standard" for the "Install Type" inside the wizard. Inside Android Studio, go to Preferences > Appearance & Behavior > System Settings > Android SDK. Click on the "SDK Tools" tab and make sure you have at least one version of the "Android SDK Build-Tools" installed. Copy or remember the path listed in the box that says "Android SDK Location." If you are on macOS or Linux, add an environment variable pointing to the Android SDK location in ~/.bash\_profile (or ~/.zshenv if you use Zsh) - eg. export ANDROID\_HOME=/your/path/here. Copy and paste these two lines to do this automatically for Bash and Zsh: [ d "\$HOME/Library/Android/sdk" ] && ANDROID\_HOME=\$HOME/Library/Android/sdk || ANDROID\_HOME=\$HOME/Android/Sdk echo "export ANDROID\_HOME=\$ANDROID\_HOME" >> ~/.bash\_profile || [ [ \$SHELL == "zsh" ] ] && echo ".zshenv" || echo ".bash\_profile" On macOS, you will also need to add platform-tools to your ~/.bash\_profile (or ~/.zshenv if you use Zsh) - eg. export PATH=/your/path/here:\$PATH. Copy and paste this line to do this automatically for Bash and Zsh: echo "export PATH=\$ANDROID\_HOME/platform-tools:\$PATH" >> ~/.bash\_profile || [ [ \$SHELL == "zsh" ] ] && echo ".zshenv" || echo ".bash\_profile" Reload the path environment variables by running: source ~/.bash\_profile. Finally, make sure that you can run adb from your terminal. On the Android Studio main screen, click "More Actions", then "Virtual Device Manager" in the dropdown. If you already have a project, then the menu will show up under the three dots menu in the top right corner of the window. Press the "Create device" button. Choose the type of hardware you'd like to emulate. We recommend testing against a variety of devices, but if you're unsure where to start, the newest device in the Pixel line could be a good choice. Select an OS version to load on the emulator (probably one of the system images in the "Recommended" tab), and download the image. Change any other settings you'd like, and press "Finish" to create the virtual device. You can now run this device anytime by pressing the Play button in the AVD Manager window. Having multiple adb versions on your system can result in the error adb server version (xx) doesn't match this client (xx); killing... This is because the adb version on your system is different from the adb version on the android sdk platform-tools. Open the terminal and check the adb version on the system: adb version And from the Android SDK platform-tool directory: cd ~\Library\Android\sdk\platform-tools /adb version Copy adb from Android SDK directory to usr/bin directory: sudo cp ~\Library\Android\sdk\platform-tools\adb /usr/bin Ask a question on the forums: Edit this page This topic describes how to quickly integrate Tuya Smart Life App SDK for Android into your development environment, such as Android Studio. It also sheds light on the initialization method and how to enable the debugging mode with a few simple steps. This allows you to run the demo app and get started with your smart life app development by using the App SDK. Prerequisites Before you start, make sure that you have performed the steps in Preparation. Starting from the Smart Life App SDK for Android 3.29.5, SHA256 hash values are required. For more information, see How to Get SHA1 and SHA256 Keys. Note: If you need to launch apps on Google Play, check whether the app re-signing feature is enabled. If so, configure the SHA256 hash values generated by Google on the Tuya IoT Development Platform. Otherwise, the error "illegal client" will occur. For more information, see How to check app signing on Google Play? If you have not installed Android Studio, visit the Android Studio official website to download Android Studio. Integrate App SDK Step 1: Create an Android project Create a project in Android Studio. Step 2: Configure build.gradle Add dependencies to the build.gradle file of the Android project. android { defaultConfig { ndk { abiFilters "armeabi-v7a", "arm64-v8a" } } packagingOptions { pickFirst "lib/\*\*/\*.so" } dependencies { implementation "com.alibaba:fastjson:1.1.67.android" implementation "com.squareup.okhttp3:okhttp-connection:3.14.9" implementation "com.tuya.smart:tuyasmart:4.0.0" } Add the Tuya IoT Maven repository URL to the build.gradle file in the root directory. repositories { jcenter() maven { url " " } maven { url " " } maven { url " " } google() mavenCentral() maven { url " " } maven { url " " } maven { url " " } } App SDK v4.0 and later are classified into Trial and Official editions. The Official edition can be used only after you pay for an annual subscription. For more information, see Pricing. App SDK v3.10.0 and earlier only support armeabi-v7a. App SDK v3.11.0 and later have integrated armeabi-v7a and arm64-v8a. If you have added .so libraries to the project, you must remove them and only use the library included in the SDK. If you want to integrate the .so library of a later version, you must remove the library of an earlier version to avoid conflicts or other possible issues. For more information, see GitHub. Step 3: Configure the security image, AppKey, and AppSecret Log in to the Tuya IoT Development Platform, go to the SDK Development page, and then click the SDK to be managed. On the page that appears, click the Get Key tab and click Download in the App Security Image for Android field. Rename the security image as t\_s\_bmp and put the image in the assets folder of your project. Return to the Android project, configure appkey and appSecret in AndroidManifest.xml, and then set permissions for the app. Step 4: Obfuscate the code Configure obfuscation in proguard-rules.pro. -keep class com.alibaba.fastjson.\*\*{\*} -dontwarn com.alibaba.fastjson.\*\* -keep class com.tuya.smart.mqttclient.mqttv3.\*\*{\*} -dontwarn com.tuya.smart.mqttclient.mqttv3.\*\* -keep class okhttp3.\*\*{\*} -dontwarn okhttp3.\*\* -keep class okio.\*\*{\*} -dontwarn okio.\*\* -keep class com.tuya.\*\*{\*} -dontwarn com.tuya.\*\* Step 5: Initialize the SDK Initialize the SDK in Application. Make sure that all processes are initialized. Example: public class TuyaSmartApp extends Application { public void onCreate() { super.onCreate(); TuyaHomeSdk.init(this); } } Configure appkey and appSecret in AndroidManifest.xml, or run the initialization code. TuyaHomeSdk.init(Application application, String appkey, String appSecret) Step 6: Disable the cloud connection Before you exit the app, you must call the following operation to disable the cloud connection. TuyaHomeSdk.onDestroy(); Step 7: Enable or disable logging In debug mode, you can enable SDK logging to facilitate troubleshooting. We recommend that you disable logging in release mode. TuyaHomeSdk.setDebugMode(true); If you integrate with the SDK v3.32.5 or earlier, remove the dependency tuyasmart-log from the build.gradle file of the Android project. This setting is not required for SDK versions later than v3.32.5. implementation("com.tuya.smart:tuyasmart:3.32.5"){ exclude group: "com.tuya.smart", module: "tuyasmart-log" } Run the demo app After you integrate the SDK, you can get the security image, AppKey, and AppSecret. Make sure that the security image, AppKey, and AppSecret are consistent with those used on the Tuya IoT Development Platform. Any mismatch will cause the SDK development to be failed. For more information, see Step 3: Configure the security image, AppKey, and AppSecret. In the following example, a demo app is used to describe the process of app development with the App SDK and indicate the SDK capabilities that you can integrate to implement smart life scenarios. Before the development of your app, we recommend that you run the demo app as needed. Feature overview The demo app supports the following features: User management: Register and log in to the app account by mobile phone number or email address. Home and device management Create a home and switch between homes. Display a list of devices in the home and control data points (DPs) of the devices. Rename and remove devices. Pair devices: Multiple pairing methods are supported, including EZ Mode, AP Mode, Bluetooth Low Energy, Zigbee Gateway, Zigbee Subdevice, QR Code, and Bluetooth LE Mesh Sub Device. For more information, see the GitHub projects tuya-home-android-sdk-sample-java or tuya-home-android-sdk-sample-kotlin. Run the sample FAQs SING\_VALIDATE\_FAILED Troubleshoot the error message: Permission Verification Failed Problem: When the system runs the demo app, an error message is returned in the following response: { "success": false, "errorCode": "SING\_VALIDATE\_FAILED", "status": "error", "errorMsg": "Permission Verification Failed", "t": 1583208740059 } Solutions: Check whether your security image, AppKey, and AppSecret are correctly configured and consistent with those obtained in Preparation. Check whether the security image is placed in the correct directory and whether the file name is t\_s\_bmp. ILLEGAL\_CLIENT\_ID After the Smart Life App SDK for Android is updated to v3.29.5, an error message is returned to indicate an illegal client. How do I troubleshoot this problem? (ILLEGAL\_CLIENT\_ID) Starting from the Smart Life App SDK for Android 3.29.5, data security is enhanced and SHA256 hash values are required. You must follow the steps in the documentation to get the SHA256 hash values and add the hash values to the Tuya IoT Development Platform. For more information, see Preparation. After SHA256 hash values are configured on the Tuya IoT Development Platform and the sample is run, the error message that indicates an illegal client is still returned. How do I troubleshoot the problem? Solution: Before you run the sample, add the following signature information to build.gradle of the app module. android { ... signingConfigs { debug { storeFile file('xxxx.jks') storePassword 'xxxxxx' keyAlias 'xxx' keyPassword 'xxxxxx' } release { storeFile file('xxxx.jks') storePassword 'xxxxxx' keyAlias 'xxx' keyPassword 'xxxxxx' } } }
